## Pre-Calc. 12

### 3.1Polynomials

In this section we will develop an understanding of the characteristics of a polynomial functions so we can sketch their graphs.

- A polynomial is an expression in the form

$$
a_{n} x^{n}+a_{n-1} x^{n-1}+a_{n-2} x^{n-2}+\ldots+a_{2} x^{2}+a_{1} x+a_{0}, a_{n} \neq 0
$$

Polynomials in standard form are written in descending order of exponents
Do examples 1 and 2 on page 113

- Shape of Polynomial Graphs are continuous (no breaks or sharp corners)

Do examples 3 and 4 on page 114

- Polynomials of the form $f(x)=x^{n}$ and $-f(x)=x^{n}$ are simply reflections of each other about the x -axis.

Do example 5 on page 114 and make a note of the end behavior of each.

| Equation of <br> polynomial | Degree of <br> polynomial | Is it Positive or is <br> it Negative? | Is it an Even <br> or is it an Odd <br> function? | End behavior |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{y}=\mathbf{x}$ | 1 | positive | Odd | Low left <br> High right |
| $\mathbf{y}=\mathbf{- x}$ | 1 | negative | Odd | High left <br> Low right |
| $\mathbf{y}=\mathbf{x}^{\mathbf{2}}$ | 2 | positive | Even | Opens UP <br> Both ends point UP |
| $\mathbf{y}=-\mathbf{x}^{\mathbf{2}}$ | 2 | negative | Even | Opens Down <br> Both ends point <br> DowN |
| $\mathbf{y}=\mathbf{x}^{\mathbf{3}}$ |  |  |  |  |
| $\mathbf{y}=-\mathbf{x}^{\mathbf{3}}$ |  |  |  |  |
| $\mathbf{y}=\mathbf{x}^{4}$ |  |  |  |  |
| $\mathbf{y}=-\mathbf{x}^{4}$ |  |  |  |  |
| $\mathbf{y}=\mathbf{x}^{\mathbf{5}}$ |  |  |  |  |
| $\mathbf{y}=-\mathbf{x}^{\mathbf{5}}$ |  |  |  |  |

| $\mathbf{y}=\mathbf{x}^{\mathbf{6}}$ |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- |
| $\mathbf{y}=-\mathbf{x}^{\mathbf{6}}$ |  |  |  |  |

What generalization can you make?
Now relate your generalization to the table on p. 115 Comparing $f(x)= \pm x^{n}$ slope of graphs

- The End Behavior of Polynomial is simply determined by the leading coefficient of a polynomial written in Standard Form. You can see this by looking at page 116.
- The Constant Value of a Polynomial Function is the y-intercept.

For example, the $y$-intercept for $5 x^{3}+3 x^{2}-x+7$ is at $(0,7)$
Do Example 6 on p. 117

- Zeros of Polynomial Functions are also known as ROOTS, X-INTERCEPTS, and SOLUTIONS $\quad$ Do Example 7 on p. 117

A Polynomial Function of Degree $n$ has at most, $n$ solutions
A Polynomial Function of Degree $n$ has at most, $n$ roots
A Polynomial Function of Degree $n$ has at most, $n$ x-intercepts
Do Example 8 on p. 118

## - Turning Points

If a polynomial has $n$ turning points, it has a minimum degree of $n+1$ (p. 118 explains this quite well)

## - Multiplicity

When one solution is repeated $r$ times, the function is said to have a solution of multiplicity $r$.

Do example 9 on p. 118
